

GROUT FOR 'DEAD' GAS SERVICE INSERTION

Ideal for use with Serviflex™

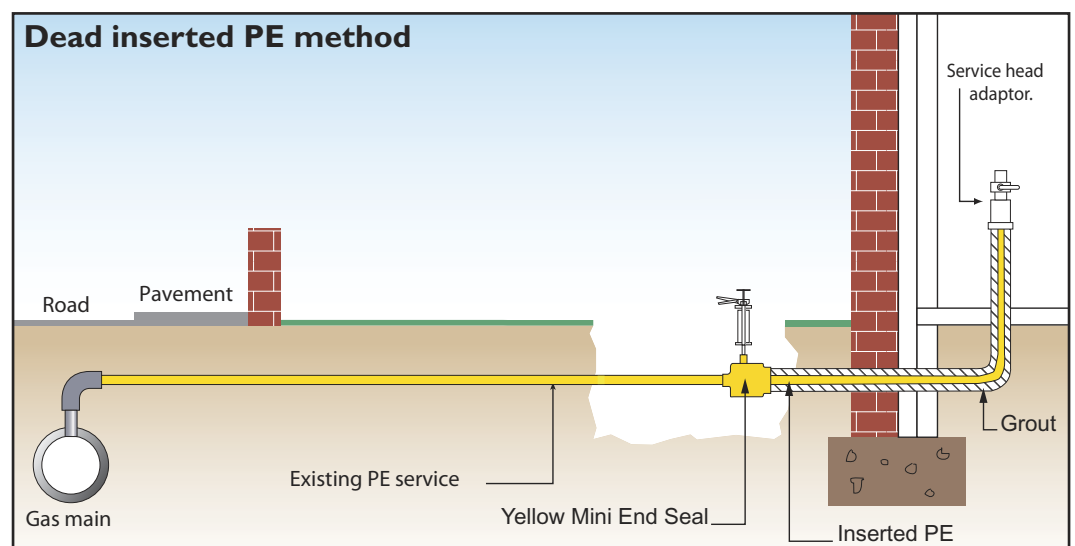

This specially formulated grout is ideal for filling the annulus on inserted services between the excavation in the garden and the meter, either when PE has been used, or Serviflex™.

The grout powder is supplied in a handy sachet into which a gauging liquid is added. The gauging liquid is supplied separately to avoid leakage if the sachet is damaged during storage or transport. However, mixing takes place entirely within the sachet. The sachet is then placed into the special barrel applicator gun and pumped into the annulus.

Grout kits are available in 2 litre size with pre-measured quantities of powder and gauging liquid to ensure that the annulus is effectively filled (see table overleaf). Multiple kits may be used if required.

Grout is injected from the garden fitting

Grout is injected through the yellow mini Endseal™

**Reliably seals
the annulus in
dead inserted
services**

**Available from
NDC Stores:**

Grout Sachet - 1342

Grout Gun - 1344

*Yellow Mini
Endseal - 1243*

GROUT TRAVEL CHART
